avi and .mov files. Noise reduction can be applied to individual frames or selected areas (sectors) of frames. Video noise reduction can also be performed automatically by the plug-in using default or user-defined noise parameters. The plug-in incorporates a noise model which analyses the video sequence, and generates a noise mask from the input video to remove noise from selected frames and sectors. This noise mask can be inspected and modified in a preview image using the software's user interface (GUI). The default mode of operation creates a noise mask from the input video and applies the resulting mask to the video frames. The input video is usually a digital camera or camcorder video sequence. The default noise settings are generated by analysing the input sequence and using the automatic noise settings to reduce visible noise and grain in the video frames. The plug-in supports video input from digital cameras, camcorders, TV tuners, avi and .mov files. Input The plug-in can process a digital camera or camcorder video input. Typically, a preview window is automatically shown during noise reduction. Noise reduction can be performed automatically, using the default settings, or a user-defined noise setting can be selected and applied. The preview window shows the resulting noise reduced video sequence, or a preview of the selected noise settings. When applying the noise settings, a preview is shown which indicates the areas of the video frames that are being affected by the noise reduction. Output The noise reduced video output is written to disk in a file format that is suitable for final quality playback in a digital video player (DVD, .avi or .mov file). Operation There are two main operation modes: The default mode applies a noise model to the input video sequence and produces a noise mask. The user mode applies a user-defined noise setting. The user setting is applied to the input video and the resulting video is saved as a.avi file. The plug-in supports various frame and area (sector) selection methods, as well as various possible output file formats. When using the default mode of operation, the plug-in uses the automatic noise settings to reduce visible noise and grain in the input video frames. When applying the noise settings, the preview window shows the video frames and sectors that are being affected. Clicking on the Preview button on the noise settings dialog window shows the video sequence being processed. The 82157476af
