Entity Framework With Oracle OracleClient Connection for NoSQL We are currently converting from SQL Server to Oracle in our web application. We are using Entity Framework with Oracle OracleClient as the provider. We are using custom migrations to handle the initial database creation, including data context creation. There are currently 2 problems with our migrations. The first is that I cannot get Oracle OracleClient to work with SQL Server Express. It requires I register the provider and set the provider to Oracle OracleClient. This is fine, but when I try to use this connection in the ORM (model first), I get this exception: Unable to determine the providerName for provider factory of connection. The second is that we are now using a NoSQL database (MongoDB) for the majority of our database interactions. Our custom migrations have these problems: Oracle OracleClient doesn't work with MongoDB. It can't figure out how to create a DbContext. Does anyone have any idea how to connect to NoSQL databases in Entity Framework with custom migrations? A: The reason the 'Unable to determine the providerName for provider factory of connection.' error is happening is because the default provider factory of Entity Framework 4 has been set to Microsoft.Data.SqlClient.
